EXPERIMENT NO.: 2

SETTING UP A ZOHO CREATOR ACCOUNT AND EXPLORING THE PLATFORM ARCHITECTURE AND INTERFACE

Aim

To create a Zoho Creator account and explore its platform architecture, features, and user interface.

Requirements

Computer or laptop, internet connection, web browser, and a Zoho Creator account.

Introduction

Zoho Creator is a low-code application development platform that helps users build business applications with minimal hand-written code. It provides visual tools for creating forms, reports, pages, and workflows. The platform helps organize business data, automate routine tasks, and manage application processes from a central workspace.

Procedure

1. Open the Zoho Creator website using a web browser.
2. Create a new account or sign in using an existing account.
3. Explore the Zoho Creator dashboard and identify its main sections.
4. Examine the application builder and the components available for creating applications.
5. Explore forms, reports, pages, workflows, and other available features.
6. Understand how applications are created, configured, and managed within the platform.
7. Navigate through the different sections of the interface to become familiar with its layout and tools.

Platform Architecture and Interface

The platform provides a workspace for creating and managing applications. Forms are used to collect and store information, while reports display records in an organized format. Pages can combine information and components into a useful screen. Workflows define actions that occur when specified events or conditions are met. These components work together to support data entry, viewing, and process automation.

The dashboard acts as the starting point for accessing applications and development tools. The application builder helps users configure components visually, while settings and management options support application configuration. The exact options available may depend on the account type and current platform interface.

Result

The Zoho Creator account was set up, and the platform architecture, application components, and user interface were explored and understood.
